                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                  Score

The P. aeruginosa proteins have antibacterial activity and can be used in vaccines and as antagonists. The proteins or their fragments, or antibodies are useful in the detection and/or diagnosis of P. aeruginosa. They are also useful for producing a vaccine and inducing an immune response against P. aeruginosa infection. An agent capable of antagonising, inhibiting or otherwise interfering with the function or expression of P1 are useful in the manufacture of a medicament for the treatment or prophylaxis of P. aeruginosa infections. The present sequence represents a probable P. aeruginosa protein N-terminal nontified semimora from the present invention
                                                                                                                                                                                                                                                                                                                                                       29-JUL-1999;

                    The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5 -end

the present invention.

detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification

oligonucleotide comprises at least 15 nucleotides and the combination of the 5-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides particularly full-length cDNAs. The primers are also useful for the

this cell line was discovered and termed protein 154 or p154. It is expressed in high quantitites in adipogenic cell lines only after cell differentiation; it its abundant in the fat pads of normal and genetically obese mice; and its expression is 3 to 5 fold higher the fat pads of obese animals compared to the fat pads of their littermates. A human fat cell cDNA library was hybridisec with a 405 bp cDNA including the 5' end of mouse p154. The positive plaques were sequenced. Clone B&B yielded DNA of 450 bp of which
                                                                                                                                                       Adipose differentiation was studied using a C3H mouse teratoma-derived cell line called 1246 is bipotential, able to differentiate into adipocytes and also muscle cells. A ZAP CDNA library was constructed from fully differentiated 1246 cells. A novel adipocyte-specific polypeptide encoded by the DNA and mRNA
                                                                                                                                                                                                                                                                                                                                   DNA encoding human or mouse adipocyte polypeptide p154 - and RNA mols. encoding p154 are used for determining susceptibility to

                                                                                                  The present sequence is that of human p154. The p154 mRNA is expressed in high quantities in adipogenic cell lines only after cell differentiation. The murine p154 mRNA is abundant in the fat pads of normal and genetically obese mice and its expression is 3 - to 5 fold higher in the fat pads of obese animals compared to the fat pads of their normal littermates. The DNA sequences (AAT4455-46) can be used to provide probes or for recombinant production of p154. The protein can be used for generation of antibodies. Both antibodies and probes can be used to determine the susceptibility of a subject to obesity. Also efficacy of anti-obesity drugs can be evaluated by contacting the drug to be tested with an adipocyte in vitro and measuring the amt. of p154 or mRNA produced, the efficacy of the drug being proportional to the decrease in the produ. of the polypeptide or mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            474 bp contained the coding region of the human p154 DNA. Homology with the mouse p154 cDNA started at AA 50 and continued to AA 197, with 798 homology.
                                                                                                                                                                                                                                                                                                                  Claim 4;
                                                                                                                                                                                                                                                                                                                                              Mammalian adipocyte p154 polypeptide and related antibodies - useful in immunoassays to assess susceptibility to obesity
                                                                                                                                                                                                                                                                                                                                                                                          WPI; 1996-361954/36.

It is thought that the protein is required for the maintenance of lipid-droplets, but this is disrupted by infection by the hepatitis c virus, which associates with the lipid droplets and downregulates the expression of ADRP. The core protein of the hepatitis c virus, which causes chronic hepatitis and liver disease, can be used to identify substances capable of interrupting the interaction of the virus and lipid droplet, and which can be used to treat or prevent infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of a number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaemia and neurodegeneration. The present sequence is one of the C. albicans proteins of the invention.
                                                                                                                                                                                                                                          25-FEB-2000;

The present sequence represents a glutamate 1-semialdehyde (GSA) aminotransferase which is an aminolevulinic acid biosynthetic enzyme. Glu-tRNA reductase converts Glu-tRNA-Glu to GSA with the concomitant release of tRNA-Glu. GSA aminotransferase then converts GSA to 5-aminolevulinic acid (ALA). ALA is used in the biosynthesis of tetrapyrrolic pigments such as chlorophyll. Nucleic acids encoding aminolevulinic acid biosynthetic enzymes are useful for isolating cDNA and genes encoding homologous proteins from the same or other plant species, for creating transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Glu-tRNA reductase; aminolevulinic acid; tetrapyrrolic pigment; chlorophyll; trans 1-semialdehyde aminotransferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rice

                                                                                                  Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify are resistance in the latent or they can be used to identify a registance in
                                        P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for
                                                                                                                                                                                                                                                                                                                  Proteins encoded by chromosome 2 of the human Plasmodium falciparum, useful as antimalarial diagnosis of P.falciparum infection -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         large amounts of the encoded polypeptides which could then be used for screening different compounds for potential herbicidal activity, and as hybridisation probes and amplification primers.
              vaccine and drug development. Parasite resistance to drugs and resistance to insecticides have led to a resurgence of malaria
                                                                                                                                                                                                                                                                                        Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Local
                                                                This sequence corresponds to a Plasmodium falciparum strain K1 pre-erythrocytic liver stage antigen 3 (LSA-3) protein. The encoding gene sequence was isolated by screening a P. falciparum strain T9/96 library with serum from a missionary treated by prophylaxis (for strain T6/96 see FR9101286). Of 20 clones isolated, clone 729S was used to screen a library generated from Thai strain K1. One clone contained a 6.85 kb insert including the genomic sequence AAT78867. The gene comprises a 1.8 kb region encoding 3 major blocks of tetraperbide

The LSA-3 peptides can be used to raise antibodies and as vaccines for immunotherapy of malaria.

J. Gen. Virol. 71;2291-2299(1990).
-i- FUNCTION: P3C, POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERT Q/G SITES IN THE POLYPROTEIN. IT MAY BE A CYSTEINE PROTEASE.
-i- SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNIT EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hypothetical
